AF2.4 · Owner-scoped retrieval of the ten domain projects

Agent Factory · measured 15 October 2026 · shipped in #3100 · prepared for Ali Muwwakkil

ASKED Make the ten provisioned domain projects reachable by the person accountable for each one.

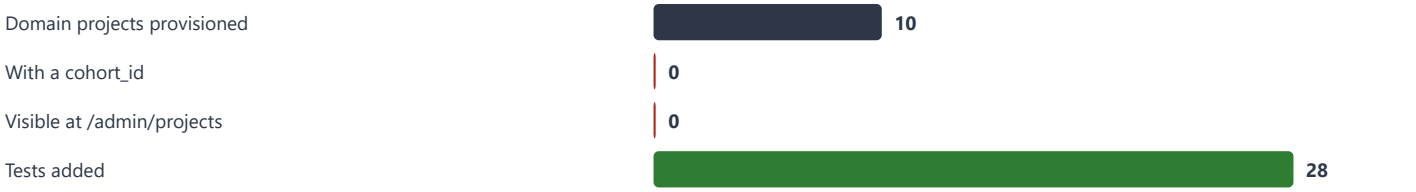
DELIVERED Two routes and a database-backed owner-scoped reader, plus the measurement that showed why nothing was reachable before.

> **TAKEAWAY**
>
> **The ten projects were provisioned and NO PAGE SHOWED THEM.**

1. **The defect was not a missing row, it was a missing join.** `/admin/projects` walks cohorts to enrollments to projects. All ten domain projects belong to one ai_staff enrollment whose `cohort_id` is NULL, so the page asks a question their rows cannot answer. Being an ordinary projects row is necessary and not sufficient.
2. **Owning nothing returns an empty list, never the full set.** The scoping branch returns early on an empty roster. Treating "no filter" as "no restriction" is how a scoping bug becomes a disclosure.
3. **Every scoping test uses a NON-ADMIN token.** Ali holds every section, so an admin-token test would pass whether or not the scoping worked.

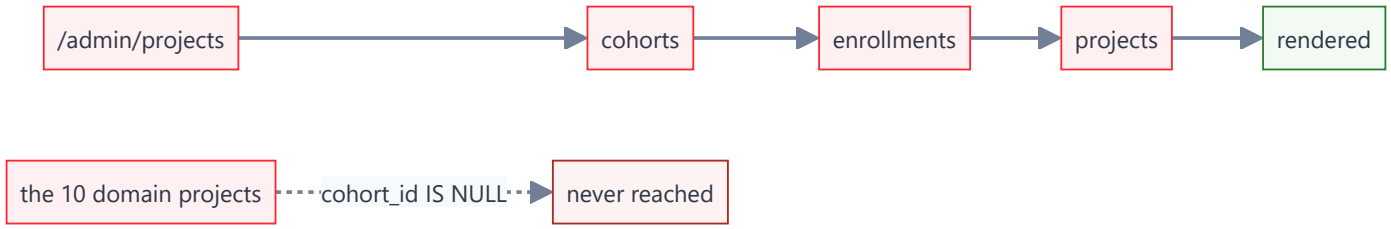
> **WHAT I GOT WRONG FIRST**
>
> I first reported these as visible at `/admin/projects`. That was false and was retracted with the query that disproves it.
>
> Kept here rather than quietly overwritten: a backfill that tidies away its own mistakes is worth less than no backfill.

Measured



Measured against production on 15 October 2026. Bars are to scale against the largest value shown.

How it works, or did not



The page walks a path the ten projects are not on. The rows were always correct; the query never asked for them.

What this does not establish

- Intern-facing scoping is NOT solved. Owner scoping is by accountable manager; `intended_builder` is a plain name with no foreign key, and two interns have duplicate enrollment rows.
- The routes are deployed and guarded (all seven answer 401, not 404) but no intern has used them.

Artifact for AF2.4, filed in 02 - Intern Management Portal and Access and attached to the ticket. Built from the same data module as the one-page visual. Backfilled on 15 October 2026 under the rule that a pull request is evidence and not an artifact.
