AF7.2 · Six independent re-grades, and what they found

Agent Factory · measured 15 October 2026 · shipped in #3120 · one page

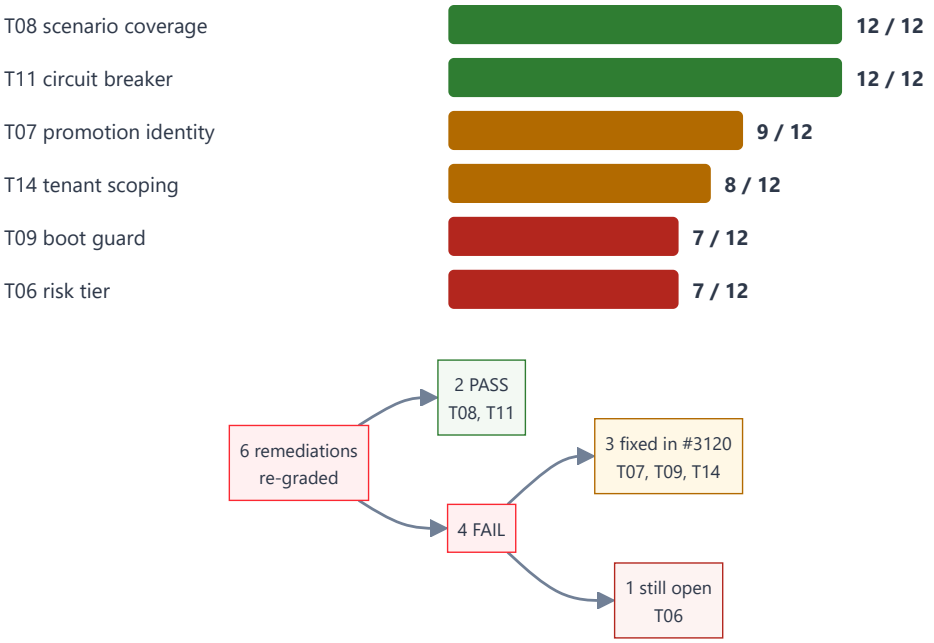
TAKEAWAY

Four of six remediations FAILED re-grading, and two scored zero on "no fabrication".

What was found

1. **T07 was a live promotion bypass, now closed.** The recorded-human allowlist was applied to the approver and never to the THRESHOLD ACCEPTOR. Ten identities promoted with zero refusals, including `auto-approval`, one letter off the production timer, and `Mallory`, whom the module already refuses as an approver on exactly the grounds a denylist cannot establish humanity.
2. **T14 was a reproduced cross-tenant WRITE, now closed.** The reconcile UPDATE had no tenant predicate while the unique index is on (tenant_id, domain_key), so it reached every tenant holding that key and destroyed their measured blocker. Proved fixed against a real Postgres with a control showing the old statement does clobber.
3. **T09 was a false claim repeated in four places.** "The ONLY one of 106 ensure* files whose post-condition throws" — there are 110 files, five throw, and mine was the only GUARDED one. The test proving uniqueness passed on a whitespace artifact.

Measured



Each verdict is out of 12. Two scored zero on criterion 6, which is "no fabrication".

What this does NOT establish

- T06 IS NOT FIXED. It needs wiring at a real write boundary, must consult `RISK_TIER_BEARING_MODELS`, must normalise case and whitespace, and must stop refusing the legitimate `R0` – `R5` values.
- T14 still owes a committed regression test. The fix was proved with a standalone probe after three failed attempts to land the test against the integration fixtures.

Built from the same data module as the AF7.2 document, so a number here cannot drift from a number there. Filed in 07 - Capability Validation and Promotion.
