About Maya

⚡ AI-DRAFTED FROM HER BUILD EVIDENCE

I design and ship AI systems that real teams use, not demos. Over twelve weeks I built **MeridianOps**, an agentic operations copilot for freight dispatch — it ingests load tenders, drafts carrier responses with a retrieval-grounded Claude agent, and routes exceptions to a human for one-click approval, keeping a person in the loop on every decision.

My strongest work sits where agent orchestration meets disciplined engineering: typed API contracts, per-tenant data isolation, and a test suite that covers the failure paths, not just the happy one. Every claim on this page is backed by a commit in my repository and verified by Colaberry's requirements engine.

THE PROJECT · ONE BUILD, TWELVE WEEKS

MeridianOps — agentic freight-operations copilot

Repo

Live preview

A multi-tenant internal tool that turns inbound load tenders into drafted, human-approved carrier responses, with exception routing and a live ops dashboard.
